

Between the GUI and the Command Line, their commonality is their function. Being able to find and look up files, you can use find, recover and rename files on your desktop or thumb drive. The GUI is a more user friendly and direct, while the Command line takes more practice and knowledge to work and use. I believe this because since we've been given keyboard lessons, we were constantly shown how to operate and navigate your files, apps and documents. You don't need to use a special word or command to change the name of file, you just right click and select. I suppose no one would teach kids the Command Line before knowing the GUI, it has a friendlier look for common people. The Command Line just gives off the hacker vibes you don't want your kids to develop in fear of the CIA or FBI knocking on the door for the strange behavior of the traffic lights. (**Or worst** they could manipulate the computer screen so every time you click on the search browser a demon pops up with the most demonic clown voice possible. And no teacher can get it off without unplugging the computer. Middle school trama, don't ask.) I not saying the Command Line is not something I want to learn, it's one of the reasons I'm taking this class, but it requires more than I initially thought it would.
